Test Plans for both the html file and the website domain

Test Type	Nature of Test	Example
Upon opening the website, all links in the header and footer should be able to be opened.	Check that the method for <a href> works and that navigation is as smooth as possible.	Click the hyperlinks associated with each webpage.
Check that the dropdown menu works.	If the menu works, it smoothens the navigable access and appeal of the website to make it easier for the user	User click down the toggle button to see if the links show up.
Check that the images show up and if not that the alt name is available.	The images links for both images currently in the folder and those that are url based should both work. It also	Open the page. View the webpages featuring images. Are they visible? Is the image too large or small?

	shows if width or height are working.	
Check that each of the webpages have been fully completed to the best extent possible	This falls under the user's requirements and recommendations for information to cover.	Click each webpage and look at the textual organization to see if it helps to guide the user with his problem
Check that the hyperlinks to other websites work.	Certain hyperlinks are directed specifically to open in new tab under =blank and others are not.	Click the hyperlinks that are supposed to directly open in new tab and check that they navigate to the correct page.
Check the link back to home page always goes back.	Linking can easily be wrong with a misplaced quotation mark; therefore, testing it makes if still possible.	Again click the home page link on both footer and header.
Check if the register and comment boxes work.	They are required fields for input so make sure the requirements and placeholders show up. Also it should link up to a database.	Type in an acceptable combination as well an unacceptable choice. Check to see if errors pop up.
